

## An overview of rubber, polyurethane & pvc hoses.

Both pvc & rubber are good for different reasons, pvc is lighter but not always as strong, pvc may perform better with certain liquids & can be cheaper, rubber will last longer than pvc in Uv light & when dragged around, but is usually heavier.

Polyurethane products are especially used in highly abrasive applications. If you are not sure which option is best, please don't hesitate to contact us for more information.

The first half of the catalogue concentrates on the most popular rubber hoses available, for conveying such mediums as air, water, oil, food & steam. These are the most popular rubber hose products we supply but not all of them. If there is a particular rubber hose you use that you can't see then please let us know as we probably supply it anyway.

The second half looks at both pvc & polyurethane hoses, again for moving water, dust, oil, food & slurry. There are many pvc hoses available, as well as ductings, these being the more commonly used ones.

The end of the catalogue dedicates just a couple of pages to hose fittings & clamps to give a brief overview. To make a brochure on the entire range would take up about 100 pages, so please bear us in mind when you are looking for a particular product.

We hope you find this brochure useful, if there is anything else you need to know or need advice on, please contact us:-
